

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Previously Presented) A swing comprising:  
a swing frame including first and second housings;  
a seat;  
first and second hanger arms that connect the seat to the swing frame; and  
first and second swing handles rotationally coupled to the first and second housings, respectively, and to the first and second hanger arms, respectively, such that each swing handle may rotate about a respective handle rotational axis between at least two positions, each of the swing handles having a hand grip portion.
2. (Previously Presented) The child swing according to claim 1, wherein the swing frame is an open top swing frame having first and second opposing handle support structures associated with the first and second housings, respectively, and wherein each of the swing handles is rotationally coupled to a respective one of the opposing handle support structures.
3. (Canceled)
4. (Previously Presented) A swing comprising:  
a swing frame; and  
two swing handles rotationally coupled to the swing frame such that each swing handle may rotate about a respective handle rotational axis between at least two positions, each of the swing handles having a hand grip portion,  
wherein one of each swing handle and each respective handle support structure includes a protrusion, and the other of each swing handle and each respective handle support structure includes a recess matched to the protrusion such that, when the protrusion is within the recess, the swing handle is locked to prevent rotation relative to the respective handle support structure.

5. (Previously Presented) The child swing according to claim 2, wherein each of the swing handles comprises a support interface portion attached to the respective handle support structure.

6. (Previously Presented) The swing of claim 1, wherein the swing frame includes first and second legs, wherein the first and second legs are pivotally connected to the first and second housings, respectively.

7. (Currently Amended) The swing of claim 1, wherein the at least two positions ~~including~~ includes a first position and a second position, the first position being substantially rotated about 180° relative to the second position.

8. (Original) The child swing according to claim 7, wherein the first position is a top position and the second position is a bottom position, the top position being substantially directly above the bottom position.

9-11. (Canceled)

12. (Previously Presented) A swing comprising:

a swing frame; and

at least one handle rotationally coupled to the swing frame such that the at least one handle may rotate about a handle rotational axis between at least two positions, the at least two positions including a first position and a second position, the first position being substantially rotated about 180° relative to the second position,

wherein the swing frame comprises at least one handle support structure, the swing handle being rotationally coupled to the frame at the handle support structure, and

wherein one of the swing handle and the handle support structure includes a protrusion, and the other of the swing handle and the handle support structure includes a recess to receive the protrusion such that, when the swing handle is at the first position and

the protrusion is within the recess, the swing handle is locked to prevent rotation relative to the handle support structure.

13. (Previously Presented) A swing comprising:

a swing frame; and

at least one handle rotationally coupled to the swing frame such that the at least one handle may rotate about a handle rotational axis between at least two positions, the at least two positions including a first position and a second position, the first position being substantially rotated about 180° relative to the second position,

wherein the swing frame comprises at least one handle support structure, the swing handle being rotationally coupled to the frame at the handle support structure, and

wherein one of the swing handle and the handle support structure includes a protrusion, and the other of the swing handle and the handle support structure includes a recess to receive the protrusion such that, when the swing handle is at the first position and the protrusion is not within the recess, the swing handle is free to rotate relative to the handle support structure.

14-15. (Canceled)

16. (Previously Presented) The child swing according to claim 6, wherein the swing frame further includes a leg fold mechanism that pivotally connects the first and second legs to the first and second housings, respectively.

17-19. (Canceled)

20. (Currently Amended) ~~A swing comprising:~~ The swing according to claim 1,  
wherein

~~a swing frame including~~ the swing frame includes first and second legs, each of the first and second legs including a length adjustment mechanism that allows the respective leg to be adjustable in length;

~~a seat coupled to the swing frame to enable swinging motion of the seat relative to the swing frame; and~~

~~a power supply and a motor to drive the swinging motion of the seat.~~

21. (Original) A swing according to claim 20, wherein the first and second legs are first and second rear legs, and wherein the swing frame further comprises first and second front legs, each of the first and second front legs including a length adjustment mechanism that allows the respective leg to be adjustable in length.

22. (Original) A swing according to claim 20, wherein each leg includes a first portion and a second portion, the first portion configured to slide within the second portion to thereby adjust the length of the leg; and wherein the length adjustment mechanism comprises a biased protrusion on the first portion and multiple holes on the second portion sized to receive the protrusion.

23. (Original) A swing according to claim 20, wherein each leg includes a first portion and a second portion, the first portion configured to slide within the second portion to thereby adjust the length of the leg; and wherein the length adjustment mechanism comprises multiple biased protrusions on the first portion and a hole on the second portion sized to receive the protrusions.

24. (Previously Presented) The child swing according to claim 2, wherein one of each swing handle and each respective handle support structure includes a protrusion, and the other of each swing handle and each respective handle support structure includes a recess to receive the protrusion such that, when each swing handle is at the first position and the protrusion is not within the recess, each swing handle is free to rotate relative to the respective handle support structure.
